Our Vets:

Dr. Ketan Iivanjee

BSc (La Trobe), BVSc (Pretoria), MRCVS (UK)

Special Interests: Small Animal Surgery, Small Animal Internal Medicine, Ophthalmology, Theriogenology, Pharmacology, Unusual & Exotic Pet Medicine & Surgery, Veterinary Practice Management.

Dr. Kelly Wilkinson

BVSc (Hons) (Melbourne)

Special interests: Small Animal Medicine, Feline Medicine, Animal Behaviour, Unusual & Exotic Pet Medicine & Surgery.

You may have already met our nurses; Natasha, Shonna, Amy and Melissa. They have pets of their own and are well versed on all clinic, hospital and cat boarding services. Please do not hesitate to ask them any questions. They will assist you as much as possible to ensure a well informed and worthwhile visit to the clinic. Our staff will eagerly assist you with your appointments, food supplies and any other questions you may have about the care and welfare of your pet. Passion, Pride and Perseverance in Service and Care is what we do.

Natasha Whitehead Cert IV (Vet. Nursing)

Areas of interest: Surgical nursing, Practice Management, Puppy Preschool, Nutrition & Behaviour, Counselling & Client Relations

Shonna Camilleri Cert IV (Vet. Nursing)

Areas of interest: Surgical Nursing, Medical Nursing, Nutrition & Behaviour, Counselling & Client Relations

Amy Monagle Studying for Cert IV (Vet. Nursing)

Areas of interest: Surgical Nursing, Medical Nursing, Nutrition, Counselling & Client Relations

Melissa Collins

Areas of interest: Nursing, Client Relations, Cattery Management

Carnegie Veterinary Clinic Hours:

Monday to Friday: 8am – 7pm

Saturday 9am – 1:30pm

Carnegie Cat Cottage – Hours of Admission and Discharge:

Monday to Friday: 10am – 1pm

Saturday 9am 1:30pm

In the unfortunate event that you would require veterinary assistance after hours please contact:

Pet Emergency Centre, 1103 Dandenong Road, Malvern East, Victoria 3145

Phone: 9569 3677 Melways Reference: 68 J3

Southern Animal Emergency Centre, 248 Wickham Road, Highbury, Victoria 3190

Phone: 9532 5261 Melways Reference: 77 H8

Winter has arrived. The nights are getting longer, the days are getting shorter and our pets are getting stiffer. The colder weather of winter often exacerbates the symptoms of arthritis. Dogs may be reluctant to run, experience intermittent lameness and have stiffness on rising. Arthritic cats may have difficulty jumping onto furniture. Often they experience bad hair days along their back, as the twisting movements required in grooming are painful. Some arthritic cats may also appear grumpy.

There are all kinds of arthritis (septic, rheumatoid, etc.) but the arthritis we refer to here is the most common of all – *osteoarthritis*, or degenerative joint disease. It is estimated that 20% of all dogs over the age of one year have some degree of osteoarthritis. This is usually a result of wear and tear on the joint cartilage but can be secondary to underlying problems such as hip dysplasia and luxating patellae (dislocating kneecaps) – both common inherited conditions.

Osteoarthritis is a progressive condition but there are many things we can do to help control and slow its progress. See your vet for advice on appropriate medications such as anti-inflammatories and chondroprotective agents. These can be administered as pills, liquids or as an injection. Never administer human anti-inflammatories to animals – some of them have serious side effects, including death! Massaging around the affected joints helps, as does a range of passive movement exercises. These involve gently bending the joint to its point of maximum flexion and extension. Controlled exercise such as leash walking and swimming helps maintain muscle bulk without putting the joints under excessive strain. Extreme sports such as ball chasing, frisbee catching, jumping and rough housing with other dogs should be avoided. Obese animals should be placed on a diet.

The winter weather brings along special challenges for our cats and dogs. While a healthy young pet with a good coat of fur will not usually find winter too hard to bear, with a few simple changes or

additions to their housing arrangements we can significantly improve their comfort this season.

Most pets that sleep inside will, in the cooler months, only require a thicker and deeper bed than usual. 'Igloo' type beds are ideal for cats because they provide a soft underlay plus an outer soft shell that helps trap the natural warmth generated by the cat. This also helps to alleviate the effect of any cold breezes coming into the house, common especially when beds are at floor level. An indoor dog likewise might just need a softer, deeper mat than usual, perhaps one with raised edges.

Outside pets, or older pets, may face extra challenges depending on the weather conditions where they live. In Australia, our winters range from warm and balmy to windy, icy and snowy, and climatic conditions can even vary slightly from suburb to suburb, and house to house! Adapt your pet's surroundings to your local 'microclimate'.

During winter, our pets need extra care. Make sure they have a warm protected bed, away from winter chills and rain. Consider taking them to the vet for a winter 'check up'. This is especially important for older pets, who may struggle through the long, cold nights.

Symptoms of disease

Brush Brush Brush

Studies have shown that a significant number of cats and dogs over the age of three years have serious dental disease. One of the key ways to prevent dental disease is daily tooth brushing. Regular brushing removes plaque that can begin to accumulate within 12 hours of eating. Plaque is a film across the teeth, which contains bacteria. A build up of plaque can become calcified. Calcified plaque, or *calculus*, irritates the gums and can cause infection beneath the gum line. This deep infection can loosen the roots of teeth and may even spread to other parts of the body including the heart and kidneys.

Dental homecare needs to begin as early as possible. Start by gently getting the young animal used to having its mouth and face handled. Stroke under the chin, then gradually lift up the lips and insert your finger along the gum line. As most dental disease occurs on the outside surfaces of the teeth, don't worry if your pet will not let you open its mouth to access the inside surfaces of the teeth.

Once your pet is used to having its mouth handled, a toothbrush can be introduced. Use a very soft baby's toothbrush or a finger brush and work in small circular movements. Care needs to be taken not to scrub too vigorously, as pet gums – like ours – are sensitive to brush trauma. Owners should aim to brush teeth at least once a day after eating. The process can be made more pleasant by using pet-friendly flavoured toothpaste. Popular varieties include shrimp, poultry

and beef flavour. A reward such as a bouncy game with a toy can also follow to complete the daily routine.

In addition to brushing, there are some excellent products on the market to help your pet's teeth stay healthy and their breath sweet. Some foods are designed as a kibble with fibres arranged in such a way as to provide a good abrasive action on the teeth. There are special chews and mouthwashes containing antibacterial substances to help prevent the build up of plaque. Abrasive foods such as bones and rawhide chews can be used but, as there are potential complications with these products, owners should check with their vet first. Your pet's annual check-up provides an excellent opportunity for your vet to check their teeth and locate troublesome areas.

NEW Competition for our readers!

Be in the running to **WIN a \$50 shopping voucher**

1) Just write the name of the feature/article that you enjoyed most in this issue:

2) Tick the box next to your preferred voucher below:

- ☐ Coles Myer Ltd
- ☐ Target Australia Ltd
- ☐ K Mart Australia Ltd
- ☐ Dymocks Book Stores
- ☐ JB Hi Fi

3) Post with your name and address on the back of the envelope to:

Your Vet Voucher Competition
Unit 5/1 Almondbury Road
Mt Lawley WA 6050

Must be received by latest post marked 31/07/2011 to be in the running

The winner of the Autumn competition was C. Conti of VIC.

**THAT'S IT!
GOOD LUCK!**

Beware – cold and flu remedies

As winter approaches, the rivers of sniffles and sneezes herald the flu season. The viruses that cause these ailments in humans are highly contagious to other people but do not affect cats and dogs. However, the medications that we take to relieve our symptoms can result in lethal side effects if ingested by our pets. Crinkly foil-wrapped pills fascinate cats, and especially young dogs, and a fun chewing game can end in the disastrous ingestion of drugs such as *paracetamol* and *ibuprofen*.

Paracetamol causes liver failure and damages red blood cells so that they lose the ability to efficiently transport oxygen around the body. Symptoms of poisoning can occur within 4 hours of ingestion, especially in cats, who are exquisitely sensitive to its toxic affects. The animal's gums will lose their normal reddish colour and become blue. They may have difficulty breathing, become depressed, have vomiting and diarrhoea and their feet and face may swell. Seizure and coma can develop and death from liver failure usually occurs 2-6 days later. *Ibuprofen* is a potent anti-inflammatory drug which, when ingested in toxic amounts, causes gut ulceration and kidney failure.

If you suspect your pet has ingested human medications, seek veterinary advice immediately. In theory, treatment for ingestion of these chemicals is possible, however successful treatment relies on early detection and aggressive therapy. Treat your pet as you would a baby and keep any medications locked away.

Emergency!

'Mangy' Guinea Pigs

Mange is the most common reason for a guinea pig to be presented to a vet. It is caused by a small mite that lives in the outer layers of the skin. The mite is transmitted by direct contact with infected guinea pigs and can often lie dormant for years. Stressors such as pregnancy, poor husbandry, poor nutrition or a change in environment can then trigger an outbreak of the disease.

Guinea pigs with mange are incredibly itchy, especially along their back. In the early stages of the disease, all that may be seen (and heard!) is the cranky 'chunterings' and 'ticklishness' of the guinea pig when the strip of hair along his back is played with. This soon progresses to hair loss and crusting skin along the back and shoulders. The intense itchiness of mange causes the guinea pig to scratch aggressively with his back legs to the point that lacerations and scabs soon appear over the affected area.

Severely affected guinea pigs will itch in such a frenzied way that they can start fitting.

There are many different treatments available from your vet to kill the mites. In addition, your guinea pig may require vitamin C supplementation and a special shampoo to lift off the scabs and crusts. It is recommended that all contact animals are treated and the cage is thoroughly cleaned.

How old is your pet?

Vets are often flummoxed during a consultation when, after asking the question, "How old is he?" they are given the answer "75". Owners commonly convert their pet's age into human years – multiplying by seven for a dog and nine for a cat.

Using this old formula is simple and easy to remember, but it does not give an accurate calculation when comparing a pet's age to humans. For example, a two-year-old cat or dog is considered an adult, whereas a fourteen-year-old teenager still has a long way to go before becoming an adult.

In the 1950s, a French veterinarian named Monsieur LeBeau devised a new method to calculate your pet's chronological age. According to his formula, a one-year-old pet has matured at the same level as a 15-year-old human. At age two, your pet has reached maturity and is chronologically the same as a 24-year-old human. Every year after two, add 4 human years to 24. A three-year-old pet is therefore 28 (24 + 4).

In dogs, there is also a considerable variation in longevity between breeds. Generally, the smaller the breed, the longer they live. A Jack Russell Terrier may happily survive to his late teens whilst a Great Dane is looking decidedly geriatric at the age of 8 years.

While it is fun to know the relative age of your pet in human years, it can also help you to understand your pet's needs as they get older. Proper nutrition, exercise, mental stimulation and regular vet care are very important and will help to keep your pet healthy and live a long and happy life.

Clever

CROSSWORD

Each of the words can be found in this issue of "Your Vet". Answers are shown on bottom of back page.

Across:

1. Type of arthritis
5. This French veterinarian devised a new way to calculate your pet's chronological age
6. Common disease in guinea pigs
7. This avian disease is also known as psittacosis or parrot fever
8. This means that the disease can be transmitted from animals to humans

Down:

2. Degenerative joint disease
3. This medication for humans may cause liver failure and damage red blood cells when ingested by pets
4. Calcified plaque

Avian Chlamydiosis

Chlamydiosis (also known as psittacosis or parrot fever) is an infrequent disease of many bird species and is caused by the organism *Chlamydophila psittaci*. This infection is generally referred to as avian chlamydiosis (AC) in birds and psittacosis in humans.

Avian chlamydiosis is a zoonotic disease, which means that the disease can be transmitted from animals to humans. The illness in people is usually respiratory and characterised by flu-like symptoms.

Recognition of the disease in birds can be difficult without pathology testing. An infected bird may display one or several of the following symptoms: eye discharge or swelling, respiratory problems (such as laboured breathing), diarrhoea, weight loss, poor appetite, lethargy or weakness. A big problem in controlling the disease is that a bird may be infected, but not show any symptoms.

Transmission between birds is primarily through inhalation of contaminated faecal or feather dust.

Any stress such as transportation, malnutrition, concurrent illness, poor ventilation, overcrowding and breeding can cause shedding of the organism. Therefore, prevention is most effective by providing a healthy diet and suitable housing for your birds to their keep stress levels as low as possible.

There is no vaccine available to prevent the disease and treatment is usually based on antibiotics, which can be administered via drops in the water, or by injections. Antibiotic dosage and treatment should be directed by your veterinarian to ensure the appropriate course of therapy is undertaken and followed.

Fun facts about birds

Ratites are a category of large, flightless birds. However, unlike other flightless birds, the ratites do not have a keel on their sternum (breastbone). Without this to anchor their wing muscles, they could not fly even if they were to develop suitable wings.

- The African Ostrich is the largest living ratite and also the largest bird in the world. It weighs up to 160 kg and stands almost 3 m high.
- The ostrich is native to Africa, yet thrives in countries all over the world.

- Of the living species, the emu is the second largest bird in the world after the ostrich and the largest bird in Australia. It can reach up to two metres in height. Like the ostrich, it belongs to the family of ratites.
- An emu is able to swim when necessary.
- Emus can run at speeds up to 45 km/hr!
- The smallest ratites are the five species of kiwi from New Zealand. Kiwis are chicken-sized, shy, and nocturnal.
- Kiwis cannot fly, and live in burrows on the ground.
- Kiwis mate for life; some have been together for 30 years!

Dr. Ketan Jivanjee

Ketan graduated Bachelor of Veterinary Science from the University of Pretoria, Onderstepoort, South Africa. Prior to that, he completed Bachelor of Science with majors in Biochemistry and Microbiology from La Trobe University, Bundoora.

Ketan is a Member of the Royal College of Veterinary Surgeons, United Kingdom. In 2003, a passion for surgery led him to complete a one year post graduate course in Small Animal Surgery conducted by the University of Sydney.

Ketan has focused on small animal practice since graduation. He spent three years in a busy small animal hospital in Albury/Wodonga honing his medical and surgical skills. His time there was both fruitful and rewarding allowing him to provide an in-depth medical and surgical service here at Carnegie Veterinary Clinic. He enjoys the rigours, challenges and diversity of a multi-faceted general practice. Out of the clinic, Ketan partakes in indoor soccer competitions.

Dr. Kelly Wilkinson

Kelly graduated Bachelor of Veterinary Science with honours from The University of Melbourne. Kelly is passionate about feline medicine. In 2002, Kelly completed a one year post graduate course in Feline Medicine conducted by the University of Sydney. Over the years, Kelly has maintained a strong focus on continuing veterinary education. She is also a member of the European Society of Feline Medicine.

Kellie's interests away from the Clinic are her two beautiful daughters – Natalie and Stephanie.

We are passionate about continuing veterinary education and ongoing learning. All members of the Carnegie Veterinary Clinic Team partake in continuing professional development to further enhance their skills and ultimately provide better service to clients and better outcomes to patients. Striving for excellence in service and care is our priority.

To provide adequate service and facilities for your needs it is necessary to charge realistic fees for treating your pet. Prompt payment of our account will help us keep the fees down. Please note that we require complete payment at the time of each consultation visit and prior to discharge from the clinic for companions that underwent in-hospital procedures. An estimate of fees can be provided for all diagnostics and treatment. We accept cash, eftpos, mastercard and visa.

The Clinic itself does not offer an account facility. If you prefer to spread the cost of expensive and extensive medical or surgical treatments, payment plans are available through our GE Money CareCredit facility. Please ask Reception for more information.

We strongly recommend Pet Insurance. Unfortunately, a Medicare type system is not in place for our pets, so the real cost of providing treatment and care must be borne by the owner. If you would like to know more about pet insurance or Petplan specifically please feel free to pick up brochures which are readily available from reception.

Nobody likes waiting. We do our best to run on time. However, occasionally there are complex cases and emergencies, so we can run behind. We appreciate and thank you for your patience.

Answers to this edition's crossword:

Across: 1. Rheumatoid; 5. LeBeau; 6. Mange; 7. Chlamydiosis; 8. Zoonotic;
Down: 2. Osteoarthritis; 3. Paracetamol; 4. Calculus.
